

Calculation Cover Sheet

PROJECT

Project Name: Dana Point Harbor
Project #: 7341
Address: Dana Point, CA

Issue Date:

May 18, 2022
Third Submittal - S3**Division:**BMI Southwest
8810 Sparling Lane
Dixon, CA 95620

Only that portion of the structure detailed in these calculations has been reviewed. No other part has been reviewed or considered unless explicitly stated. Bellingham Marine is not responsible for any other part of the structure or for any work designed or performed by others which may impinge on this work.

DANA POINT HARBOR REVITALIZATION

Design Standards:

2019 CBC, 2018 IBC, ASCE 7-16, ACI 318-14, ACI 440.1R-15, AISC 360-16

Layout Guidelines for Small Craft Berthing Facilities, Prepared by California State Parks Division of Boating and Waterways (DBAW)

City of Newport Beach Waterfront Project Guidelines and Standards, Harbor Design Criteria Commercial and Residential Facilities, 2017 Edition

Project Summary Data for Structural Design:

Design Freeboard	18 inches	± 1 in.	
Live Load (uniform)	40 / 65 psf (marina / outer basin)		DBAW C3.1
Live Load (concentrated)	400 lbs		NBWPGS
Risk Category	II		NBWPGS
Factored Wind Speed	95 mph (3-sec gust)		ASCE 7
Wind Exposure Category	D		ASCE 7
Wind Sheltering Factor	15 % (beam winds)		
Wind Sheltering Factor	20 % (bow-stern winds)		
Factored Wind Pressure	19 psf		See derivation next page
Berthing Impact Velocity	2 fps		see footnote 1
Berthing Impact Angle	10 degrees from centerline of float		
Vessel Displacement	12^*L^2 lbs (L in ft)		

Inner Basin:

Design Wave Height (H_s)	1.00	ft.	see footnote 2
Design Wave Length	30	ft.	

Outer Basin:

Design Wave Height (H_s)	2.10	ft.	see footnote 3
Design Wave Length	50	ft.	

(1) Berthing loads are not codified, however, the velocity, angle of impact and vessel weight are common specification requirements that have been in use for 20+ years on many US marinas.

(2) $H_s 1.0 \times L = 30$ ft. is a standardized specification used for well protected marinas. Dana Point inner basins meet this definition and prior experience with the existing structures validates the selection of this design criteria.

(3) The outer basin wave height and length arrived at by examination of studies by Everest International Consultants (Subject: Dana Point Harbor Revitalization Commerical Core Project Coastal Engineering Support Services - Wave Uprush Analysis, Date: April 7, 2014)

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

Factored wind pressure (W) calculated per ASCE 7-16

$$q_z = 0.00256 K_z K_{zl} K_d K_e V^2 \quad (\text{eq. 26.10-1})$$

$$W = F/A_f = q_z G C_f \quad (\text{eq. 29.4-1})$$

95 = V , ASCE 7-16 3 sec gust @ 33' elev [mph] (Fig. 26.5-1A, risk category II)
D = Exposure Category (26.7.3)

1.03 = K_z , velocity pressure exposure coefficient (Table 26.10-1, height above ground <15')

1.0 = K_{zl} , topographic factor (26.8)

0.85 = K_d , wind directionality factor (Table 26.6-1)

1.0 = K_e , ground elevation factor (Table 26.9-1, use 1.0 for sea level)

0.85 = G , gust-effect factor (Section 26.11, similar to low-rise building)

1.0 = C_f , force (drag) coefficient (AS 3962, 2001; Uhlmann, 1997)

16.0 = W_{\min} , minimum wind pressure [psf] (Section 29.7)

17.2 = W , wind pressure [psf]

Use **19 psf** for design. This exceeds code minimums. 19 psf is the standard wind pressure used by BMI in the California market with many successful marina designs.

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

Basis of Design

Structural System (Inner Basin and Charter Docks)

The project consists of new prefabricated modular concrete floating docks which replace the existing floating dock system.

The new docks are held in place by steel pipe piles (mooring piles) which are driven into the underlying soils and provide lateral restraint only. There are no vertical loads on the guide piles other than self-weight of the steel pipe. All vertical loads on the floating docks are resisted by buoyancy forces acting through the concrete float modules.

The docks are connected to the mooring piles using freely sliding collars at each pile. These collars (pile guides) allow vertical movement of the docks to accommodate water level changes and vertical loading while providing full restraint for all lateral loads. There is a small gap between the pile faces and guide pads which is necessary to account for construction tolerances and normal dock movement. This gap is considered in the structural analysis of the dock system and does not result in adverse effects. Numeric modelling of the lateral load transfer from the docks to the piles has been performed and is provided in this report.

The walkways consist of individual concrete float modules connected by FRP structural wales. The concrete modules utilize expanded polystyrene (EPS) foam infill for positive buoyancy under all conditions. The FRP wales run longitudinally along each side of the concrete modules, forming a composite beam consisting of FRP flanges and a reinforced concrete center section. The wales are secured to the modules by $\frac{3}{4}$ " diameter fiberglass reinforced threaded rods (FRP thru-rods) which transit the full width of the dock. Thru-rods are spaced as required to transfer loads from the float modules to the wales and other structural elements of the dock system.

The finger piers are single piece concrete float modules connected to the walkways at regular intervals by triangular shaped steel gusset frames. The triangle frames are secured to the walkways and fingers by $\frac{3}{4}$ " diameter FRP thru-rods. The finger piers use FRP facia on both sides to secure the cleats and to attach fendering elements. The fascia is not part of the primary structural system.

All concrete modules are reinforced with solid round fiberglass (FRP) rebar complying with ASTM D7957. FRP is non-ferrous and will not corrode and is an excellent choice for marine construction. Design of the FRP reinforced concrete structure follows the guidance of ACI 440.1R-15 which is referenced in the commentary of ACI 318-14. Per ACI 440.1R-15 minimum cover for FRP reinforcement is $\frac{3}{4}$ ".

The attached analysis provides module design capacities based on using minimums for concrete shell thickness and module depth. It is understood that production modules may be slightly stronger due to thicker walls or deeper modules. Specific analysis of the stronger components is not included or necessary.

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

Structural System (Outer Basin Post Tensioned Docks)

A portion of the floating docks in the outer basin utilize bonded, post-tensioned segmental concrete construction for the primary structure. The individual segments consist of conventionally reinforced concrete shells around an EPS foam core and are reinforced with galvanized mesh and epoxy coated deformed bar. Each segment is match cast against an adjoining segment to provide structural mating faces. Offset alignment keys are provided to ensure proper mating.

The segments are assembled in the water and joined by full-length tensioned 150 ksi high-strength post-tension bars. After tensioning, the post-tension ducts are flushed with fresh water and grout is pumped into the annulus between the bars and duct walls to provide a fully bonded post-tensioned concrete structure. Bar ends are trimmed after tensioning and protected by grease-filled caps.

Design Loads

Seismic

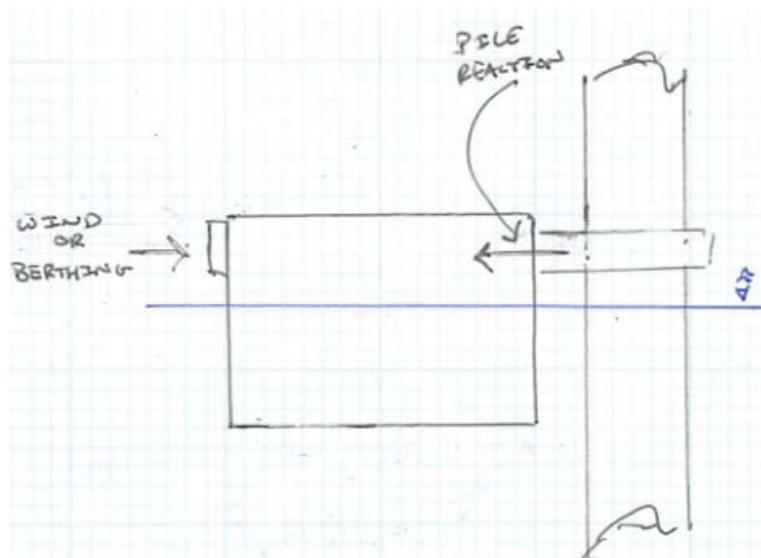

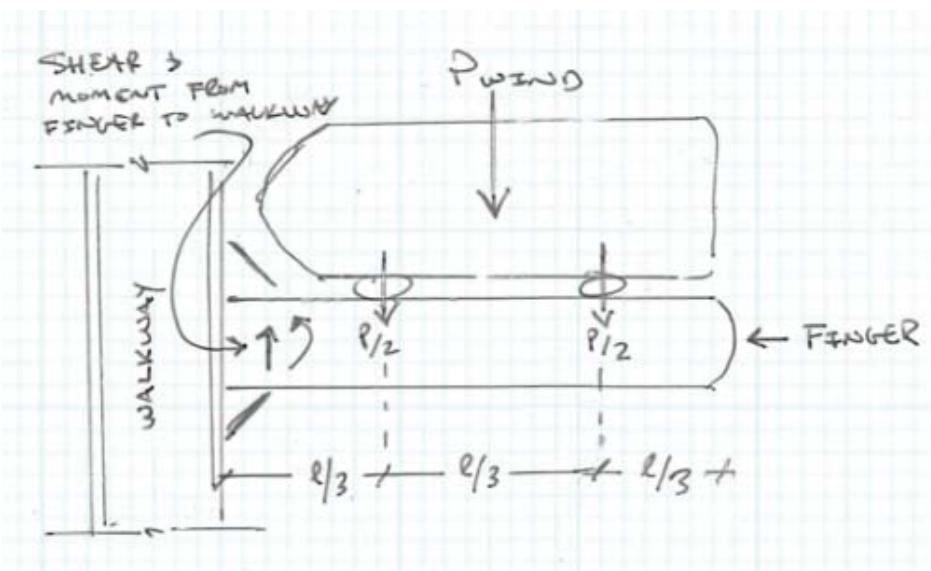

The floating marina elements are isolated from seismic accelerations by virtue of floating on an interface which is not able to transmit lateral shear. I.E. the water in the basin will not accelerate laterally with the underlying soils and cannot transmit lateral forces to the floating docks. The pile themselves are sufficiently ductile with no seismic mass except for self-weight and are OK by inspection.

Berthing (B)

The docks are designed to resist the loads imparted by vessels as described in the project summary.

Wind (W)

For lateral analysis, individual finger piers are designed to support full loads as if no sheltering is provided by adjacent vessels. Lateral analysis is also performed for the docks in the fully occupied configuration and sheltering by adjacent vessels is accounted for. Each "dock" (walkway + finger piers) is analyzed individually without consideration of sheltering by adjacent docks. Lateral loads are transferred from the docks into the cantilevered mooring piles. Lateral loads are introduced and reacted just below the deck level, torsional couples are negligible, see diagram below.

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

Lateral Wave (LW)

Lateral wave forces are calculated using the methods outlined in British Standard BS 6348-6 Section 2.4.4.3. For the protected inner basin the 1 ft wave produces negligible results and lateral wave is not included in analysis. For the outer basin the lateral wave force is taken as a distributed load applied to the entire face of the dock. This is a conservative simplification as waves are irregular and will not be applied uniformly to the entire dock at the same time.

$$\rho := 64 \frac{\text{lb}}{\text{ft}^3}$$

$$H_{s,1,0} := 1.0 \text{ ft}$$

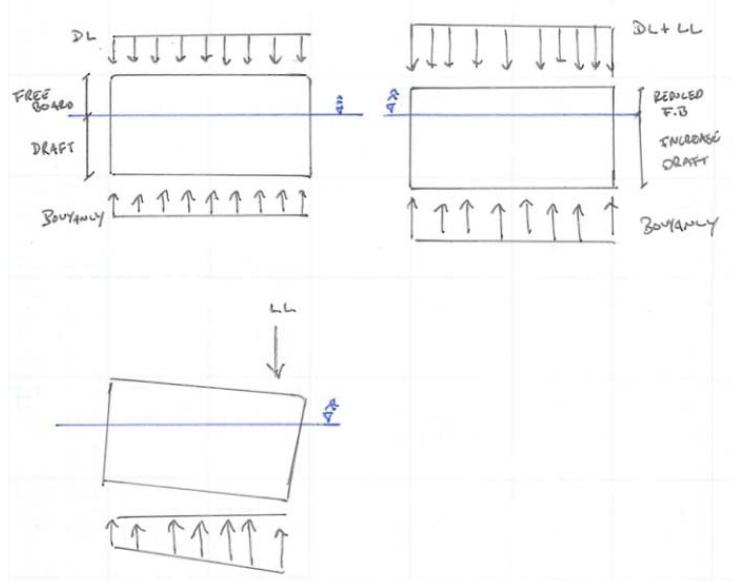

$$WL_{1,0} := \left(\frac{1}{8}\right) \cdot \rho \cdot g \cdot (H_{s,1,0})^2 = 8 \frac{\text{lbf}}{\text{ft}}$$

$$H_{s,2,1} := 2.1 \text{ ft}$$

$$WL_{2,1} := \left(\frac{1}{8}\right) \cdot \rho \cdot g \cdot (H_{s,2,1})^2 = 35.3 \frac{\text{lbf}}{\text{ft}}$$

Vertical Dead and Live Load (DL, LL)

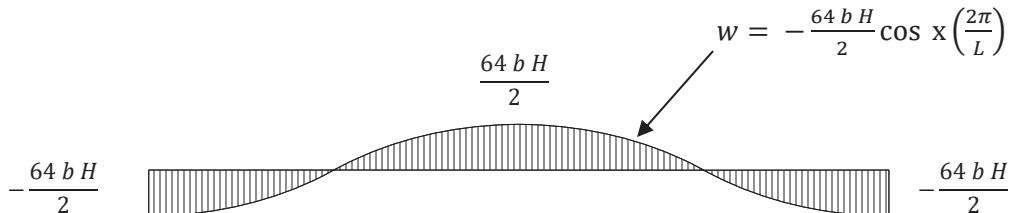

Vertical loads are resisted by the buoyancy force imparted on submerged portions of the dock. All concrete modules are designed to float at the target freeboard under dead load. As live load is added the draft (displacement) increases to provide compensating buoyancy. Offset live load will cause the float to roll slightly. The roll is further mitigated by the attached fingers. Torsion loads are minimal and OK by inspection. See diagrams below:

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

Vertical Wave (VW)

Vertical wave demand is calculated using a quasi-static method using a sinusoidal wave profile with amplitude equal to the significant wave height (H_s).

Load Diagram

Integrate load function to determine shear

$$\begin{aligned} V &= \int -\frac{64 b H}{2} \cos x \left(\frac{2\pi}{L} \right) \\ &= -\frac{64 b H}{2} \left(\frac{L}{2\pi} \right) \sin x \left(\frac{2\pi}{L} \right) + c \end{aligned}$$

Shear = 0 at ends of float, at $x = 0$ and $x = L$, hence $c = 0$

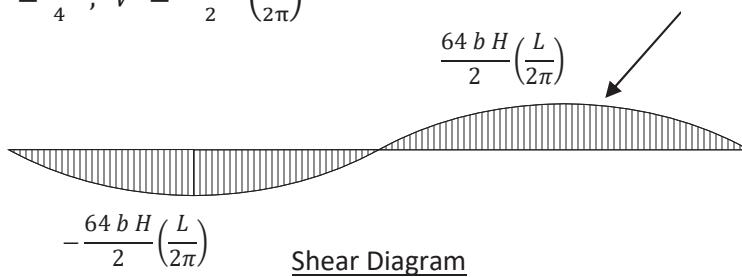

$$@ x = 0 , V = 0$$

$$@ x = \frac{L}{4} , V = -\frac{64 b H}{2} \left(\frac{L}{2\pi} \right)$$

$$@ x = \frac{L}{2} , V = 0$$

$$@ x = \frac{3L}{4} , V = \frac{64 b H}{2} \left(\frac{L}{2\pi} \right)$$

$$V = -\frac{64 b H}{2} \left(\frac{L}{2\pi} \right) \sin x \left(\frac{2\pi}{L} \right)$$

Shear Diagram

Integrate shear function to determine moment

$$M = \int -\frac{64 b H}{2} \left(\frac{L}{2\pi} \right) \sin x \left(\frac{2\pi}{L} \right) dx$$

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

$$= \frac{64 b H}{2} \left(\frac{L}{2\pi} \right)^2 \cos x \left(\frac{2\pi}{L} \right) + c$$

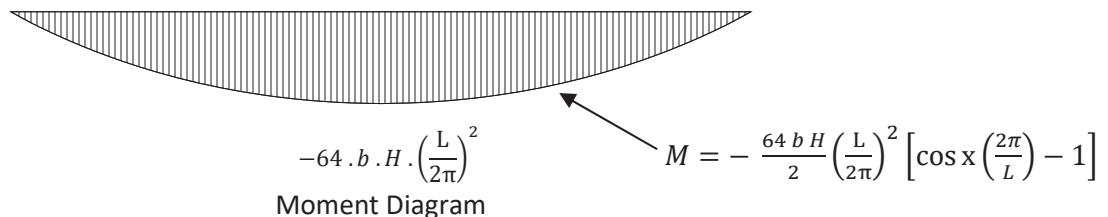

Moment = 0 at ends of float, at $x = 0$ and $x = L$, hence

$$c = - \frac{64 b H}{2} \left(\frac{L}{2\pi} \right)^2$$

@ $x = 0$, $M = 0$

$$@ x = \frac{L}{4} , M = - \frac{64 b H}{2} \left(\frac{L}{2\pi} \right)^2$$

$$@ x = \frac{L}{2} , M = -2 \left[\frac{64 b H}{2} \left(\frac{L}{2\pi} \right)^2 \right]$$

Load Combinations

Vertical Load Combinations –

- a. 1.2DL + 1.6LL
- b. 1.6VW

Lateral Load Combinations –

- a. 1.0W + 1.6LW
- b. 1.6B

Combined Loading –

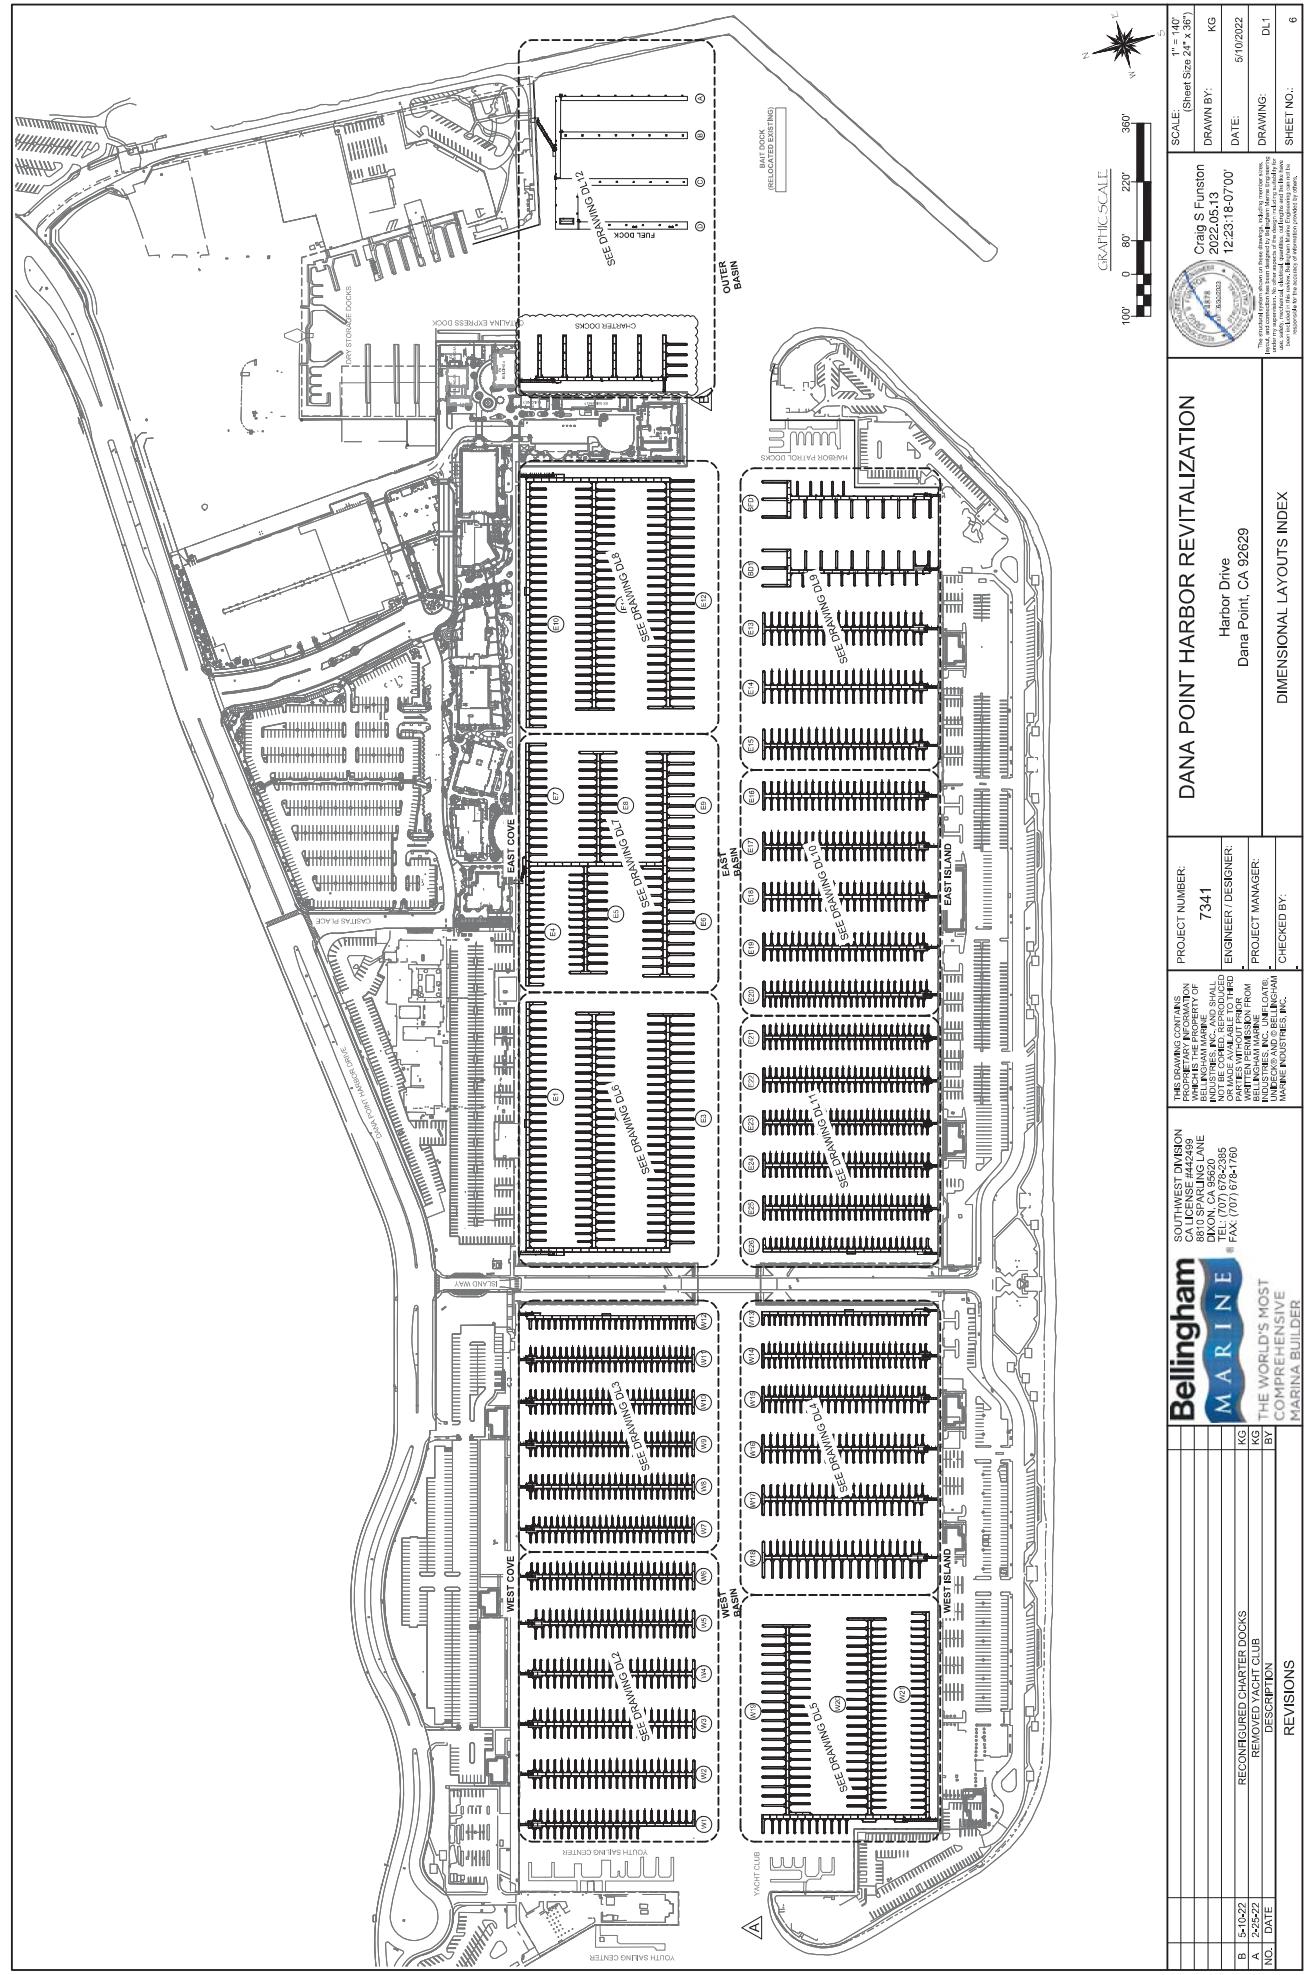

All load cases checked for combined vertical and lateral loads. The sum of squares check is acceptable given that peak vertical loads and peak lateral loads are unlikely to occur simultaneously for a sustained amount of time. In the following equation D and C are demand and capacity, respectively.

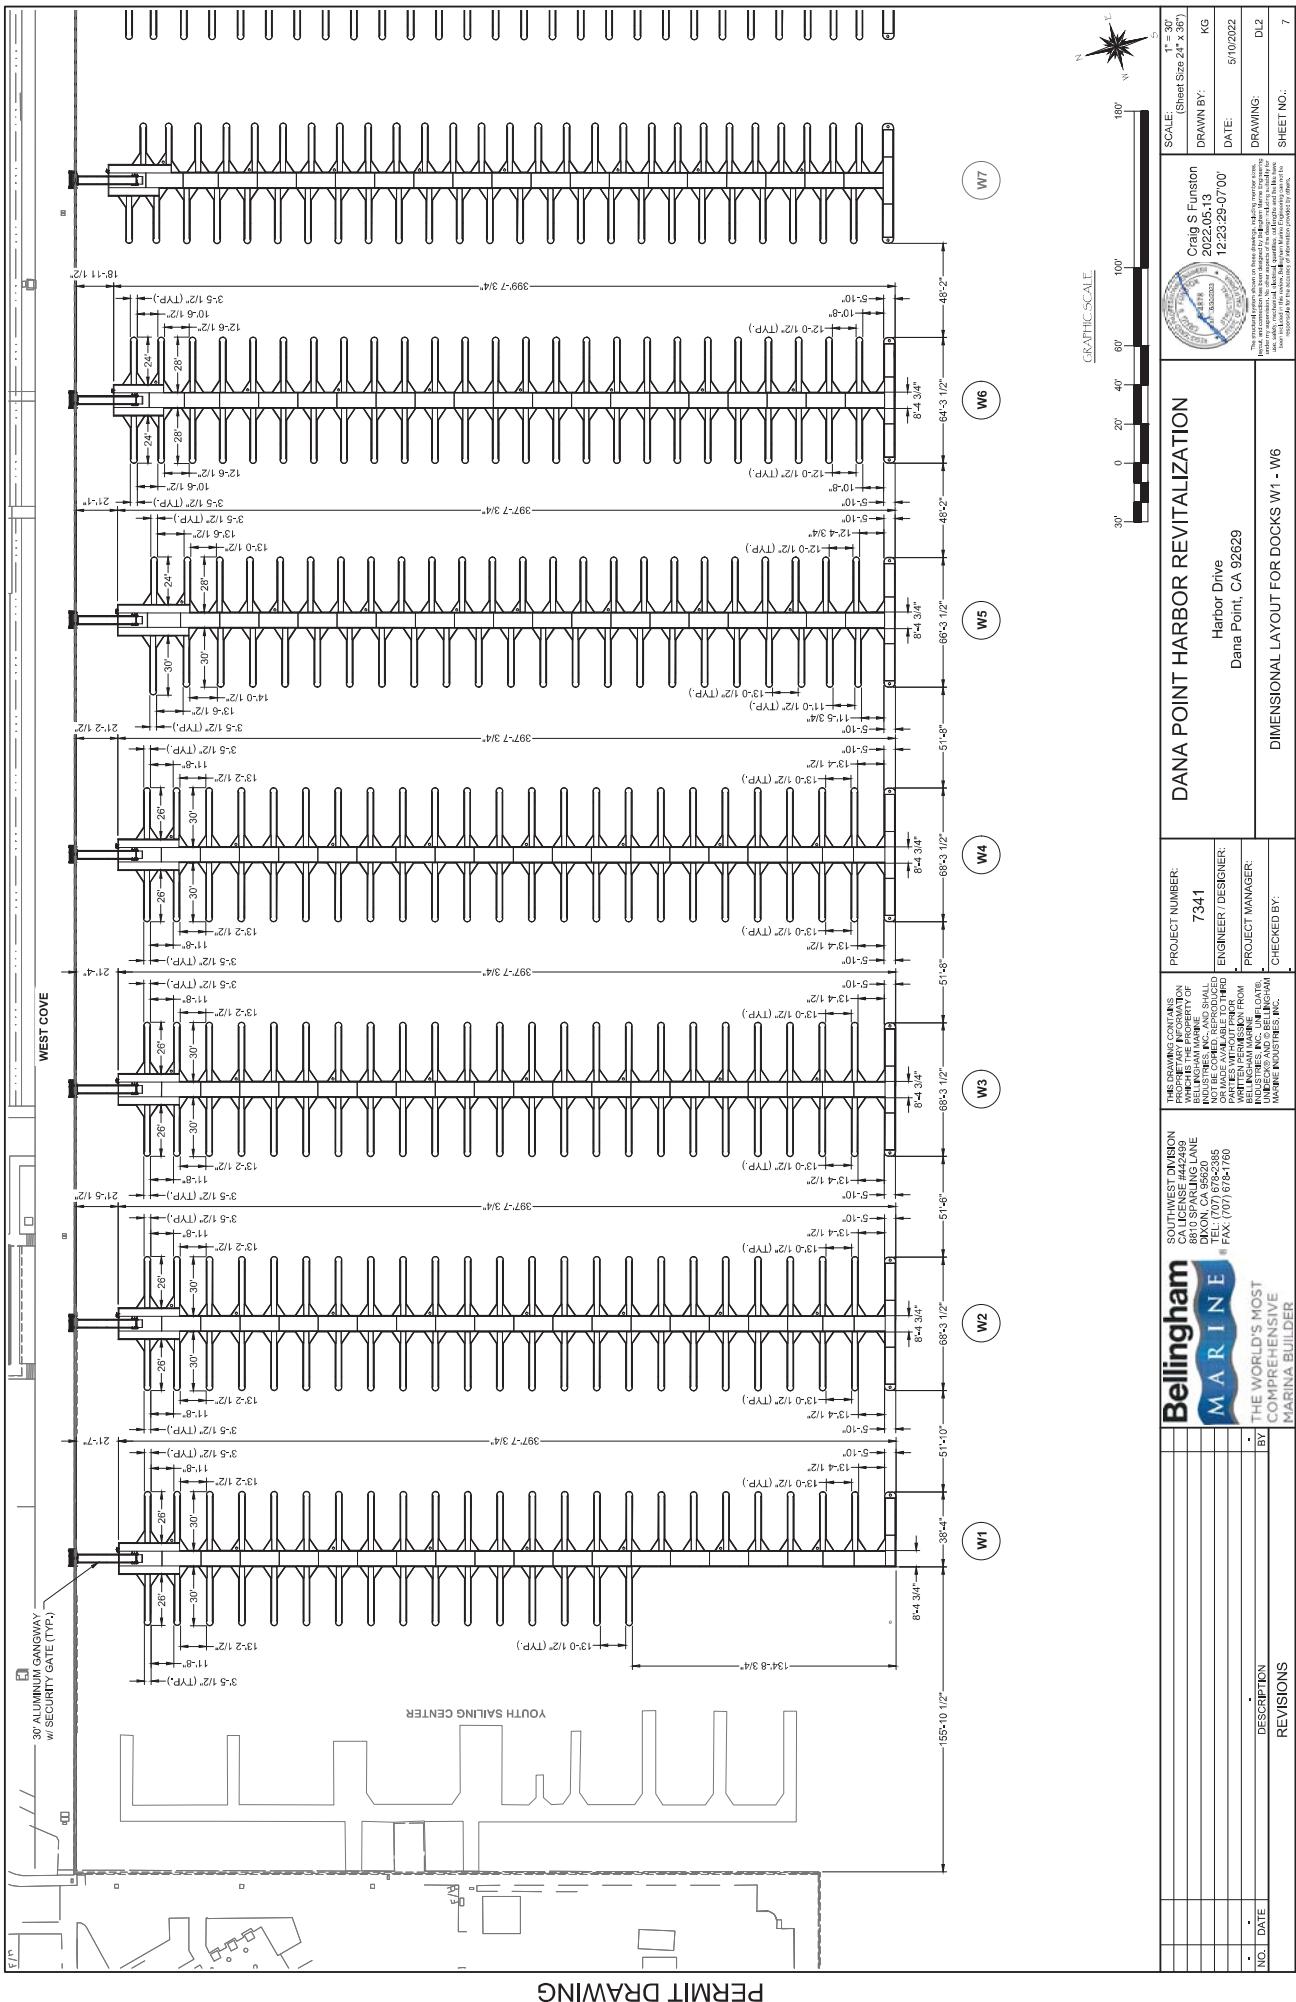

$$\sqrt{\left(\frac{D_{vertical}}{C_{vertical}} \right)^2 + \left(\frac{D_{lateral}}{C_{lateral}} \right)^2} < 1.0$$

NOMINAL FLEXURAL STRENGTH CALCULATION BASED ON EQUALIBRIUM OF FORCES AND STRAIN COMPATIBILITY AS SHOWN IN THE DIAGRAM.

FAILURE IS GOVERNED BY FRP RUPTURE WHERE $f_{fr} = f_u^* \times C_e$.

COMPRESSION FORCES ARE APPROXIMATED WITH AN ACI RECTANGULAR STRESS BLOCK.

APPLY A STRENGTH REDUCTION FACTOR, Φ , EQUAL TO 0.55 (ACI 440.1R-15 7.2.3)

TENSILE REINFORCEMENT PROVIDED IS AT LEAST 1/3 GREATER THAN THAT REQUIRED BY ANALYSIS TO SATISFY MINIMUM REINFORCEMENT REQUIREMENTS (ACI 440.1R-15 7.2.4).

NOMINAL SHEAR STRENGTH CALCULATION CONSIDER RESISTANCE FROM TOP DECK ONLY. CONTRIBUTIONS FROM OTHER PORTIONS OF THE THE FLOAT MODULE ARE IGNORED.

APPLY A STRENGTH REDUCTION FACTOR, Φ , EQUAL TO 0.75 (ACI 440.1R-15 8.1.1)

Moment and Shear Capacity of Singlecast Floats for Vertical Loading

Minimum Concrete Depth	ΦV_n [kips]	ΦM_n [ft-kips]		Minimum Reinforcement per Corner #5	#6

50			0.43	30.0	0.8	0.8	33.9	1.2	54.2

V = vessel velocity

$I_{yy} = I_{gross}/2$ to account for cracking. Assumed 36" deep float.

θ = approach angle

Float depths from 30"-42" have negligible effects on the results.

$K_{connection}$ = connection stiffness

K_{dock} = finger stiffness

E_{finger} = finger modulus of elasticity

P_{finger} = equivalent lateral load to finger end

L = finger and vessel length

L_t = triangle frame length

W_f = concrete float width

Wt_v = vessel weight

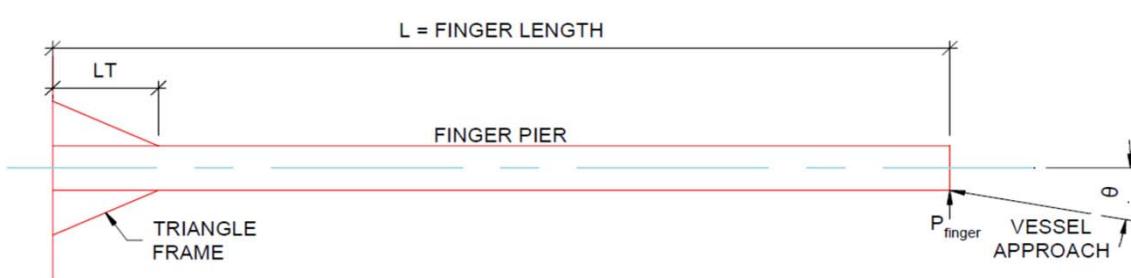

$V_{finger,max}$ = max. shear outside of triangle frame zone

M_{max} = maximum moment

$V_u = 1.6 \times V_{max}$

$M_u = 1.6 \times M_{max}$

Note: berthing calculation based upon conservation of energy principals and dock stiffness

Bellingham, WA 98229
T 360.715.0121

Lifting and Handling - Maximum Allowable Float Length

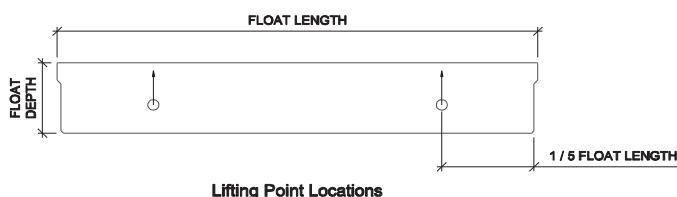

Design Criteria:

- Reinforcing Criteria determines maximum lifting length based on LRFD design.
- Cracking Criteria determines maximum lifting length based on minimum concrete strength and factor of safety = 3.0
- Section properties are derived from minimum wall and deck thicknesses.
- Sections with thicker walls than the minimum values will require deeper float depths to maintain design freeboard.
- Sections with depths greater than the minimum are acceptable because capacity increases faster than demand with increasing depth.
- Concrete strength is minimum value at the time of lifting.

Demand:

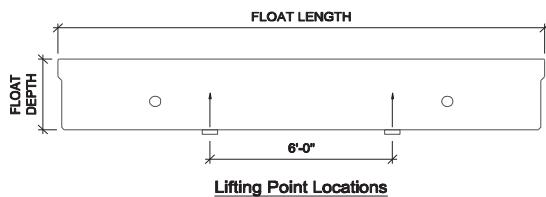

- Two Load Cases

Case 1: floats picked at L / 5 from float end - controls bottom reinforcing

Design Freeboard =	18	in
Water Density =	64	pcf
Concrete Weight γ_c =	125	pcf
Lightweight concrete factor, λ =	0.85	
Load Factor =	1.4	
Impact Factor =	1.8	
Factor of safety for cracking =	3.0	
Strength reduction factor, flexure ϕ_f =	0.9	

Case 2: floats picked with fork lift at mid float - controls top reinforcing

Floats

Float width	2'-7"	3'-7"	4'	5'	7'-6"	9'-6"		
Min. Depth	(in)	40	36	34	34	32	32	
Reinf. (per corner)		1 - #4 Bars	1 - #6 Bars	1 - #5 Bars	1 - #6 Bars	1 - #5 Bars	1 - #5 Bars

FRP Wale Design

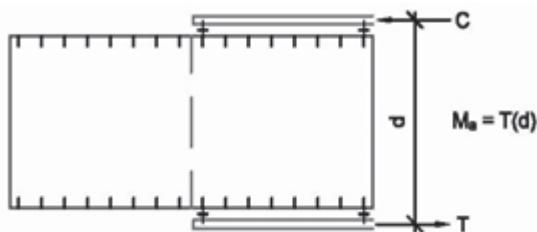

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

FRP Wale Design Check

The concrete walkway modules are connected by FRP wales secured with 3/4" diameter FRP thru bolts.

Check Lateral Bending:

Lateral bending is resisted by the moment couple between the wales.

Tension/compression in the wales is transferred to the concrete module through the FRP thru bolts. Bearing capacity is the controlling factor for this connection. Testing indicates a strength level bearing capacity at this connection equal to 7.8 kips.

Calculate lateral bending capacity considering the narrowest walkway:

$$w := 7 \text{ ft} + 6 \text{ in} \quad \text{minimum walkway width}$$

$$d := w$$

$$n := 2 \quad \text{minimum number of FRP bolts per wale per float module}$$

$$R_b := 7.8 \text{ kip} \quad \text{bolt bearing capacity}$$

$$\phi M_n := w \cdot n \cdot R_b = 117 \text{ ft} \cdot \text{kip} \quad > \text{Mu} = 106 \text{ ft-kip}$$

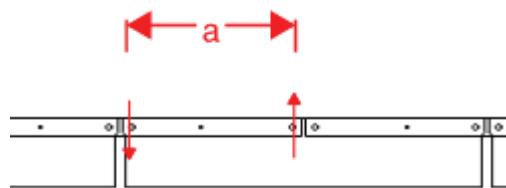

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

FRP Wale Design Check (cont.)

Check Vertical Bending:

Vertical moment is resisted by major axis bending in the FRP.

Bending in the wale is transferred to the concrete module through the FRP thru bolts. Bearing capacity is the controlling factor for this connection. Testing indicates a strength level bearing capacity at this connection equal to 7.8 kips.

Calculate vertical bending capacity. Compare capacity against demand from the widest walkway:

$$a := 6 \text{ ft}$$

minimum distance between FRP bolts

$$R_b := 7.8 \text{ kip}$$

bolt bearing capacity

$$\phi M_n := 2 \cdot a \cdot R_b = 93.6 \text{ ft} \cdot \text{kip} > M_u = 22.2 \text{ ft-kip}$$

4'x6' Triangle Frame Element Capacity Check

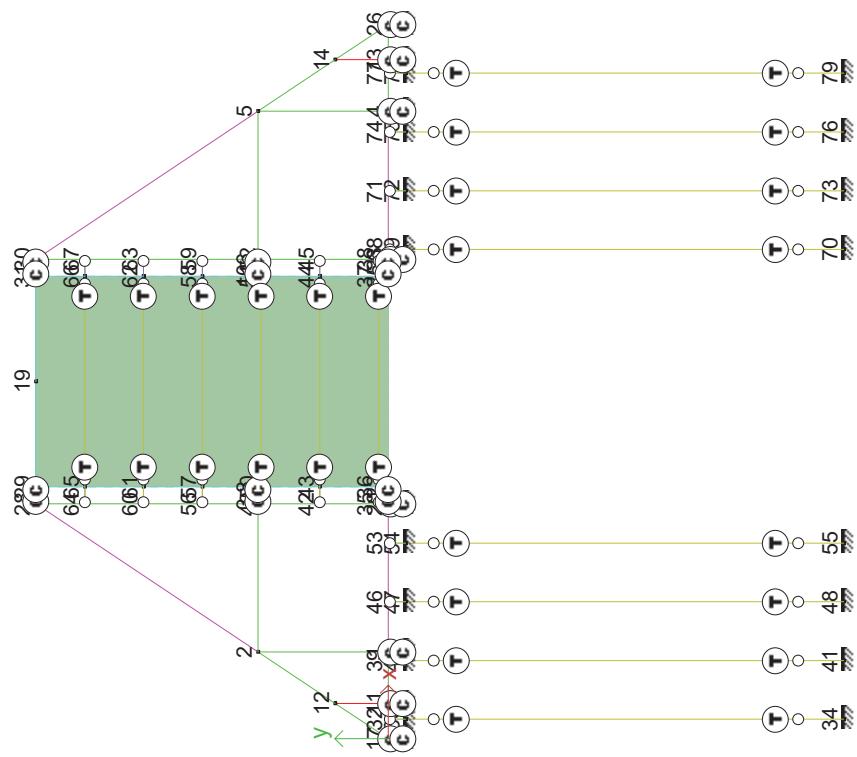

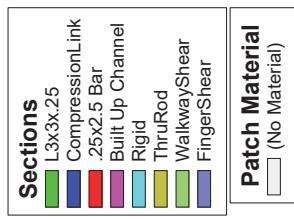

7.1	= P [kips]
135.4	= M [ft-kips]

Maximum load on finger frame, see Concrete Module Design in previous section

Element Capacities per AISC 360-16

Element	M _{max} [ft-kips]	V _{max} [kips]	C _{max} [kips]	T _{max} [kips]	ΦM _n [ft-kips]	ΦV _n [kips]	ΦC _n [kips]	ΦT _n [kips]

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

Gangway Attachment

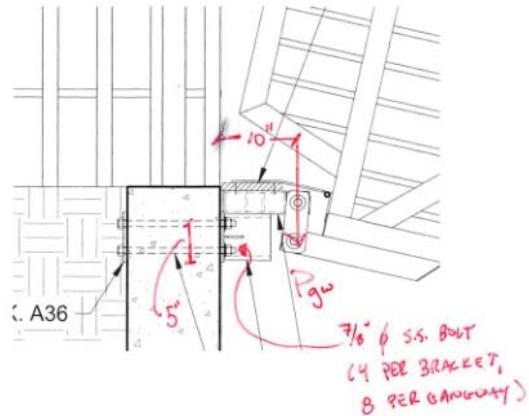

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

TYPICAL GANGWAY CONNECTION:

GANGWAY CONNECTION TO SEAWALL IS SIMILAR TO EXISTING. SAME GANGWAY CONNECTION BRACKET IS USED FOR THE 30' AND 80' GANGWAY, DESIGN FOR 80' GANGWAY.

GANGWAYS ARE ATTACHED WITH A SWING SHACKLES WHICH ALLOW FOR ROTATION. GANGWAY IS NOT FIXED AT THE BOTTOM AND IS FREE TO ROLL AND UNABLE TO INDUCE ANY LATERAL LOADS.

FOR DESIGN CONSIDER VERTICAL LOADS ONLY.

$$DL := 15 \text{ psf}$$

Includes weight of structure + utilities, from experience this is a conservative estimate.

$$LL := 100 \text{ psf}$$

$$P_{gw} := (1.2 \cdot DL + 1.6 \cdot LL) \cdot (5 \text{ ft} \cdot 80 \text{ ft}) \cdot \left(\frac{1}{2}\right) = 35.6 \text{ kip}$$

Check Shear on Bolts:

$$n := 8 \quad \text{number of bolts}$$

$$V_u := \frac{P_{gw}}{n} = 4.5 \text{ kip}$$

$$\phi V_n := 12.2 \text{ kip} \quad \text{OK, AISC Steel Construction Manual Table 7-1}$$

Check Tension on Bolts:

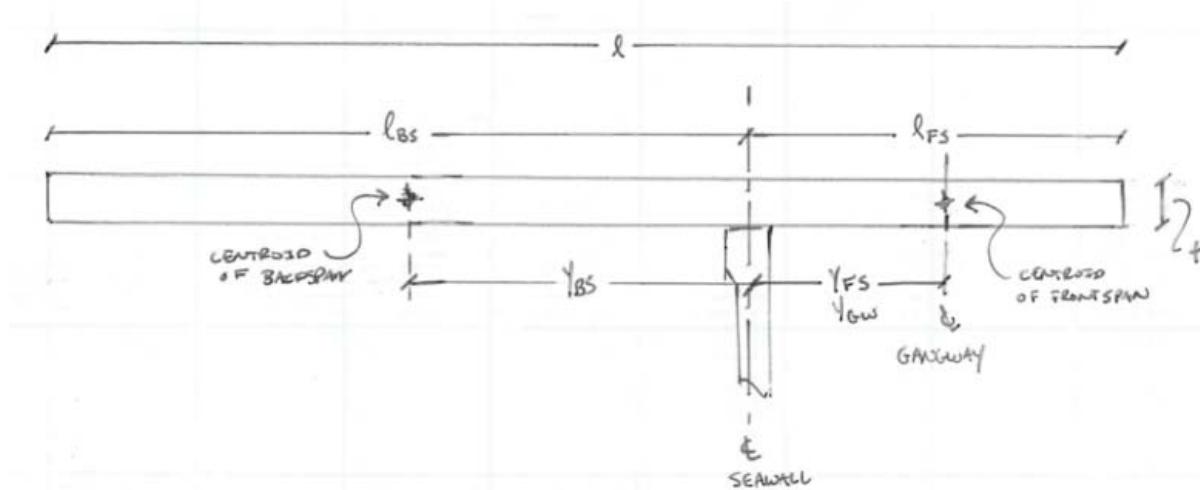

$$n := 8 \quad \text{number of bolts}$$

$$T_u := P_{gw} \cdot \left(\frac{10 \text{ in}}{5 \text{ in}}\right) \cdot \left(\frac{2}{n}\right) = 17.8 \text{ kip}$$

$$\phi T_n := 20.3 \text{ kip} \quad \text{OK, AISC Steel Construction Manual Table 7-2}$$

CANTILEVER GANGWAY ABUTMENT:

Check overturning:

$$\gamma := 150 \text{ pcf} \quad \text{density of concrete}$$

$$b := 9 \text{ ft} \quad \text{width of platform}$$

$$t := 12 \text{ in}$$

$$l := 21 \text{ ft}$$

$$l_{FS} := 8 \text{ ft}$$

$$l_{BS} := 13 \text{ ft}$$

$$y_{FS} := \frac{l_{FS}}{2} = ?$$

$$y_{BS} := \frac{l_{BS}}{2} = 6.5 \text{ ft}$$

$$y_{GW} := 4 \text{ ft}$$

1323 Lincoln St.
Bellingham, WA 98229
T 360.715.0121

Check overturning (continued):

calculate weights:

$$GW_{DL} := 0.5 \cdot 4 \text{ ft} \cdot 30 \text{ ft} \cdot 12 \text{ psf} = 0.7 \text{ kip} \quad \text{gangway dead load}$$

$$GW_{LL} := 0.5 \cdot 4 \text{ ft} \cdot 30 \text{ ft} \cdot 100 \text{ psf} = 6.0 \text{ kip} \quad \text{gangway live load}$$

$$FS_W := b \cdot t \cdot l_{FS} \cdot \gamma = 10.8 \text{ kip} \quad \text{front span weight}$$

$$BS_W := b \cdot t \cdot l_{BS} \cdot \gamma = 17.6 \text{ kip} \quad \text{back span weight}$$

check front span moment vs back span moment, consider factored loads on the gangway:

$$FS := FS_W \cdot y_{FS} + (1.2 \cdot GW_{DL} + 1.6 \cdot GW_{LL}) \cdot y_{GW} = 85.1 \text{ ft} \cdot \text{kip}$$

$$BS := BS_W \cdot y_{BS} = 114.1 \text{ ft} \cdot \text{kip}$$

$$FS < BS = 1.0 \quad \text{OK}$$

Check reinforcement:

$$M_u := 1.2 \cdot FS_W \cdot y_{FS} + (1.2 \cdot GW_{DL} + 1.6 \cdot GW_{LL}) \cdot y_{GW} = 93.7 \text{ ft} \cdot \text{kip}$$

$$A_{s_req} := \frac{M_u}{4 \cdot 10 \text{ in}} \cdot \left(\frac{\text{in}}{\text{ft} \cdot \text{kip}} \right) \cdot (\text{in}^2) = 2.3 \text{ in}^2$$

$$A_{s_provided} := 17 \cdot 0.31 \text{ in}^2 = 5.3 \text{ in}^2 \quad \text{OK, (17) #5 bars provided}$$
